PassiveIntent — Zero Egress Security Attestation

Attestation Statement: > The @passiveintent/core SDK is engineered strictly as a zero-egress behavioral engine. It is mathematically designed to process user heuristics entirely within the client's local browser environment.

Technical Verification: As part of our continuous integration (CI) pipeline, every release of the @passiveintent/core source code undergoes static analysis. We certify that the core SDK contains:

- **ZERO** instances of the fetch() API.
- **ZERO** instances of the XMLHttpRequest (XHR) API.
- **ZERO** instances of WebSocket instantiations.
- **ZERO** instances of navigator.sendBeacon().

Data Privacy Impact: > Because the engine is physically incapable of transmitting data over a network, it does not collect, process, or transmit Personally Identifiable Information (PII) to any external server. It functions strictly as a local operational cache.
